**EXCESS CAPACITY IN THE GLOBAL STEEL INDUSTRY AND THE IMPLICATIONS OF
NEW INVESTMENT PROJECTS**

by Anthony de Carvalho, Naoki Sekiguchi and Filipe Silva

OECD, Paris

ACKNOWLEDGMENTS

Government and industry representatives participating in the OECD Steel Committee are increasingly concerned about excess capacity in the global steel industry. Excess capacity has led to deterioration in the financial situation of steelmakers and is raising questions about its impact on the longer-term economic viability and efficiency of the industry. As a result, the OECD Steel Committee plans to deepen its work on excess capacity in the next biennium. This paper combines two documents that were declassified by the Steel Committee in early 2015, one that summarises the main policy issues regarding excess capacity and one which focusses on monitoring new steel investment projects taking place around the world. The Secretariat would like to thank all delegations that have contributed actively to the Steel Committee's activities on excess capacity, particularly those that provided very useful comments and feedback on the two papers that were combined to form this Policy Paper. Nevertheless, any remaining errors or omissions are the responsibility of the Secretariat.

EXECUTIVE SUMMARY

Governments participating in the OECD Steel Committee consider excess capacity as being one of the main challenges facing the global steel sector today. Following the Ministerial Council Meeting on 6-7 May 2014, where Ministers stressed the need to address the issue of excess capacity in some industries such as steel, the OECD Steel Committee has deepened its discussions on capacity, and will take this work further in the next few years. To increase visibility of the key issues, the Steel Committee declassified two papers linked to excess capacity in early 2015. Those two papers have been combined to form this Policy Paper on excess steelmaking capacity and the implications of new investment projects.

More specifically, this paper examines the extent, causes, and impacts of excess capacity in the global steel industry, and provides detailed information on new investment projects that are taking place around the world in order to help governments and industry better understand the extent to which excess steelmaking capacity may evolve in the future. For readers interested in knowing further details about investment developments taking place in the global steel industry, an Annex is provided that presents tables with detailed information on the companies that are investing and the financial amounts involved, the technologies being invested in, the ownership status of the projects and their expected starting date, as well as some qualitative comments about the projects to provide context where needed.

The results indicate that global steelmaking capacity will continue to expand, with regions that are currently net importers of steel products expected to record the largest capacity increases. Of particular importance for governments in this context will be to work towards removing market distorting policies such as subsidies that promote the emergence of new capacity or delay the closure of failing companies. The main findings of this paper are:

- **Excess capacity remains high.** The global steel industry's capacity to produce steel has more than doubled since the early 2000s to support growing construction and manufacturing activity, as well as to help build infrastructure particularly in emerging economies. With investment projects continuing to increase in a number of economies, and while steel consumption growth is anticipated to remain moderate, the global imbalance between capacity and demand will continue to pose risks for the industry for the foreseeable future, unless more concerted efforts are made by industry and governments to address the challenge. Global nominal steelmaking capacity is projected to increase to 2.36 billion tonnes by 2017, up from 2.16 billion tonnes in 2013. Non-OECD economies will continue to lead the capacity expansion in the global steel industry, with their share of world capacity expected to increase to 71.4% by 2017.
- **Government interventions are contributing to global excess capacity.** Specific concerns related to government steel policies include continued government subsidies (notably subsidies for the creation of new capacity or the maintenance of inefficient capacities) and continued approvals for new steel facilities. Governments have also noted that trade related measures, constraints on foreign investment, and the activities of government financial agencies are also contributing to global excess capacity and creating difficulties for the industry in addition to weak market conditions.

- **Excess capacity is hurting the global steel industry.** Excessive levels of steelmaking capacity have important implications for the steel industry, resulting in over-supply, low prices, weak profitability, bankruptcies and localised job losses. Given the global nature of the industry, excess capacity in one region can displace production in other regions, thus harming producers in those markets and creating risks for trade actions and government interventions to protect domestic industries. It can also lead to wasteful energy use and thus have negative environmental impacts.
- **What should be done?** In competitive economies, it is the responsibility of the steel companies themselves to identify ways to adapt to changing market conditions. The role of governments should be to allow market mechanisms to work properly and avoid measures that artificially support steelmaking capacity. Of particular importance for governments will be to work towards removing market distorting policies such as subsidies that promote the emergence of new capacity or delay the closure of failing companies, eliminating trade and investment barriers that slow the restructuring that is needed for the industry, allowing market-based investment decisions in the steel sector, and ensuring that new plants are subject to standards that protect the environment and uphold worker safety.

1. Introduction

Excess capacity is one of the main challenges facing the global steel sector today. The growing gap between global steelmaking capacity and demand has led to deterioration in the financial situation of steelmakers, and has raised concerns about the longer-term economic viability and efficiency of the industry. Although excess capacity in the global steel industry has increased significantly since the financial crisis, and despite slowing demand growth in global markets, there continues to be new investment projects in many parts of the world.

On the one hand, while the opening and closure of steel plants is usually based on the commercial decisions of private companies, government interventions that support the building of new capacity or keep inefficient facilities in operation can exacerbate the problem of global excess capacity and harm the business conditions of efficient steel producers in all markets. On the other hand, policies that promote the efficient restructuring of the industry or provide assistance to workers who may be displaced by the closure of uneconomic mills can be useful tools to address the problem and promote greater stability in global steel markets.

Following the Ministerial Council Meeting on 6-7 May 2014, where Ministers stressed the need to address the issue of excess capacity in some industries such as steel, the OECD Steel Committee has deepened its discussions on capacity, and will take this work further in the next few years.¹ In addition to monitoring capacity developments, the Committee plans on examining government policies and their effects on global excess capacity, with an aim to reach a common understanding about which policies: i) promote a better functioning of the market and more efficient global steel industry; and ii) contribute to excess steelmaking capacity by distorting trade and competition in domestic and global markets.

This paper examines the extent, reasons and impacts of excess capacity in the global steel industry, as well as the implications of new investment projects that continue to take place at a rapid pace in many parts of the world. By focussing on new investment projects taking place in the global steel industry, this study intends to help governments and industry better understand the extent to which global steelmaking excess capacity may evolve in the future. The information on individual investment projects presented in the Annex of this paper is also provided via an online database available to the public at www.oecd.org/sti/steel.²

This Policy Paper finds that global steelmaking capacity will continue to expand, with regions that are currently net importers of steel products expected to record the largest capacity increases. Global nominal

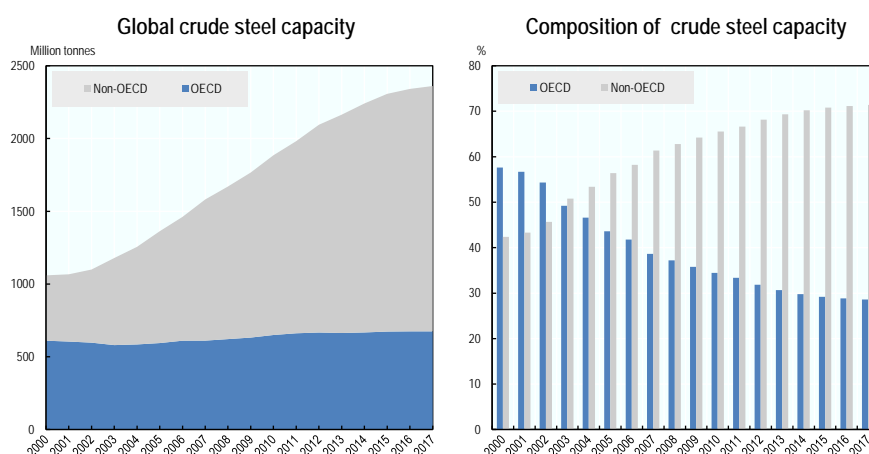

steelmaking capacity is projected to increase to 2.36 billion tonnes by 2017, up from 2.16 billion tonnes in 2013. Non-OECD economies will continue to lead the capacity expansion in the global steel industry, with their share of world capacity expected to increase to 71.4% by 2017. Of particular importance for governments in this context will be to work towards removing market distorting policies such as subsidies that promote the emergence of new capacity or delay the closure of failing companies.

The remainder of the paper is organised as follows. The next two sections briefly summarise the extent and reasons for global excess capacity. The fourth section provides an overview of steel projects currently taking place around the world, but leaves details about the types of equipment and furnaces that companies are investing in for the tables in the Annex. The final two sections summarise some of the OECD’s work on the impacts of excess capacity and what should be done to address the challenge. Again, readers interested in the details of investment projects by company and region are invited to refer to the Annex or to the above-mentioned online database.

2. What is the extent of global excess capacity?

The global steel industry’s capacity to produce steel has increased rapidly since the early 2000s, after two decades of little growth. Most of the growth in steelmaking capacity has occurred in non-OECD economies, to support growing construction and manufacturing activity, as well as to help build the infrastructure necessary for the economic development of these emerging economies. The world’s nominal steelmaking capacity is estimated to have reached 2 241 million metric tonnes (mmt) in 2014, according to the OECD Secretariat, a level that is more than twice as high as the 1 060 mmt capacity level observed in 2000. With investment projects continuing to take place in many parts of the world, nominal global steelmaking capacity is expected to climb by a further 120 mmt in the period to 2017, bringing total worldwide capacity to 2 361 mmt. At that point, non-OECD economies are expected to account for approximately 71.4% of the world’s total capacity (Figure 1).

Figure 1. Nominal crude steel capacity in OECD and Non-OECD economies

Source: OECD Secretariat.

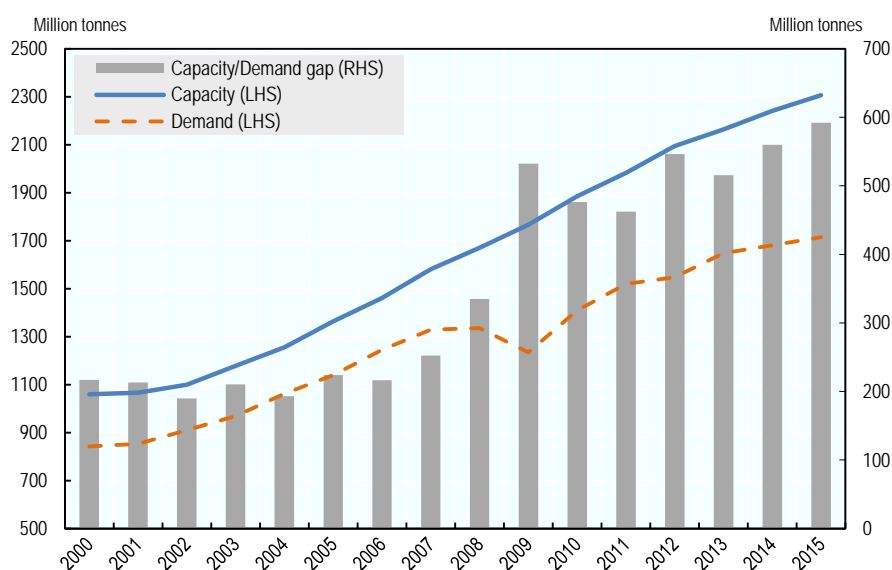

Whether or not excess capacity arises is a function of whether demand has kept pace with this rapid growth in supply. Although the industry is emerging from a severe cyclical downturn that was triggered by the global economic and financial crisis of 2008-2009, demand recovery has been uneven and sluggish in many economies. In 2013, crude steel demand stood at 1 648 mmt, or about 516 mmt below nominal capacity, representing one of the highest gaps in the history of the global steel industry (Figure 2). With investment projects continuing to increase in a number of economies while steel consumption growth is anticipated to remain moderate, the global imbalance will continue to pose risks for the industry for the

PP ON STEEL EXCESS CAPACITY & INVESTMENT

foreseeable future, unless more concerted efforts are made by industry and governments to address the challenge.

However, it is important to note that measures of excess capacity cannot be imputed directly from the gap between nominal capacity and demand. Indeed, it is not economic for the steel industry to run at full capacity, even when pricing is attractive and companies appear to be maximising their output. During the peak of the pre-crisis price upturn in the first half of 2008, for example, monthly global capacity utilisation did not rise above 91%.¹ Seasonal factors as well as the need to occasionally close down operations to refurbish steel plants and add new facilities tend to reduce the effective capacity of steel mills.

Figure 2. World crude steel capacity (nominal) and demand

Notes: The Secretariat assumes demand growth of 2% in 2014 and 2015. These are the most recent rates of growth forecast by the World Steel Association for world apparent steel use (October 2014 Short Range Outlook).

Sources: OECD for nominal capacity and the World Steel Association for demand.

3. What are the reasons for global excess capacity?

The main factors that contribute to capacity imbalances in the steel industry include market downturns, but also a number of government interventions and other market-distorting practices. As noted above, for most steel mills, it is normal to have periods of under-utilised capacity. When demand and prices of steel fall, profit-maximising firms should reduce production and thus leave a certain amount of capacity idle. Profits will tend to be lower because the firms still have to finance their fixed assets, including their under-utilised steelmaking furnaces and rolling facilities. If the situation persists over time, however, then firms operating under normal market conditions would try to minimise their fixed costs by scaling back on capacity, thus making excess capacity a short-run phenomenon. History has nevertheless demonstrated that the adjustment process can be long and arduous in the steel industry, with some regions experiencing extended periods of excess capacity.

¹. Monthly capacity utilisation rates are according to World Steel Association data.

On the one hand, this can be due to high exit barriers, namely the costs of closure that discourage rapid adjustments in capacity. For example, capacity closures entail high costs of dismantling the mills, potential clean-up and other environmental and labour-related costs. In the face of market uncertainty firms may choose to delay exit rather than incur such costs. Expectations about future market conditions may also be contributing to current excess capacity; for example, steelmakers in some countries are investing heavily today in new steel production facilities in anticipation of much higher demand several years from now.

On the other hand, excess capacity that persists over time can also be indicative of government actions that hinder adjustments that would normally occur in competitive markets. Due to the importance and strategic nature of the steel industry to many national economies, a tendency during market downturns is to preserve the capacity of the industry, in order to alleviate unemployment and other social problems that would otherwise occur due to capacity closures. In addition, in some large net steel-importing regions, governments are also interested in moving towards greater “self-sufficiency” in steel production in order to reduce their dependency on imports. Research by the Secretariat shows that, despite current market conditions, a large number of new projects are taking place, which will increase global crude steelmaking capacity significantly in the coming years.

In the current context, recent discussions at the OECD Steel Committee have suggested that in some regions excess capacity reflects temporary factors related to the business cycle while in other cases it reflects structural factors connected to government interventions. Specific concerns related to government steel policies include continued government subsidies (notably subsidies for the creation of new capacity or the maintenance of inefficient capacities) and continued approvals for new steel facilities. Governments have also noted that trade related measures, constraints on foreign investment, and the activities of government financial agencies are also contributing to global excess capacity and creating difficulties for the industry in addition to weak market conditions. And finally, policy measures which discourage “optimal” exit of the least productive plants may also contribute to excess capacity.

4. Future investment projects in the global steel industry

4.1. Brief summary of regional investment developments

Since the start of the 21st century, many blast furnaces have been built around the world, particularly in Asia (see Box 1). That region will continue to lead BF/BOF capacity expansions, supported by large-scale integrated projects. As a consequence, the BF/BOF route is likely to remain the major technology for iron/steelmaking, despite the announcement of many mini-mill projects in recent years. However, this paper shows that regional differences are very large. Detailed information can be found in the tables in the Annex, while a summary of key developments by region is provided below:

- There are no capacity additions being planned in the **European Union**.
- In the region referred to as “**Other Europe**”,³ crude steelmaking capacity is forecast to increase to 64.4 million tonnes per year (tpy) by 2017. All of the increase in this region will occur in Turkey, where many EAF projects are taking place. In line with EAF capacity expansions, imports of scrap are expected to grow further in “Other Europe”. Iron ore imports into the region are also expected to increase to some extent as some projects are intensive in iron ore/coking coal.
- In the **Commonwealth of Independent States (CIS)** region, steel mills are replacing out-dated OHFs with BOF and EAF furnaces. Numerous EAF projects have been planned, which may result in higher future scrap demand. Nevertheless, the BOF process is likely to remain the main

PP ON STEEL EXCESS CAPACITY & INVESTMENT

production process in the region. As a consequence of several investment projects, steelmaking capacity in the region is expected to reach 152.9 million tpy by 2017.

- In the **North American Free Trade Agreement (NAFTA)** region, the share of EAF in steel production is expected to rise due to many DRI-based mini-mill projects, supported by the shale gas boom and the relatively low natural gas prices associated with this development. DRI is expected to be an increasingly important feedstock for producers in the region. Steelmaking capacity in the region is projected to increase from 158.0 million tpy in 2013 to 163.5 million tpy in 2017.
- In **Latin America**, BOF's share is likely to grow in the future owing to many greenfield slab-for-export projects, even though some projects have been postponed. Also, some projects in the long products segment are under way. As a result of these investment projects, steelmaking capacity in the region is forecast to reach 77.4 million tpy by 2017.
- Although **Africa** is still reliant on imports to meet demand, some DRI-based mini-mill projects are expected to raise the region's self-sufficiency (domestic production as a share of demand) gradually. Steel production via the EAF route is expected to remain the major steelmaking process. Steelmaking capacity in the region is forecast to increase from 33.2 million tpy in 2013 to 40.2 million tpy by 2017.
- In the **Middle East**, steelmaking is expected to be predominantly EAF-based, and the preferred feedstock would remain DRI (due to natural gas availability). Many DRI-based EAF projects have been announced recently in the region, and are expected to contribute to reducing import dependency. The region's production capacity is projected to increase to 69.5 million tpy by 2017.
- In **China**, steel production via the BOF route is expected to continue to play a dominant role in steelmaking. However, EAF's share could gradually increase in the future, along with the increasing availability of scrap, thus affecting the balance between BOF and EAF technologies. Steelmaking capacity in the country is expected to reach 1.1 billion tpy by 2017.⁴
- Although EAF is still the major steelmaking process in **India**, BOF's share may increase significantly, supported by new investment projects that are iron ore/coking coal-intensive. The country's crude steelmaking capacity was estimated to have reached more than 100 million tpy in 2013, and is expected to continue to increase to a level of 132.7 million tpy by 2017.
- In **ASEAN-6**, BOF's share in the region's crude steel production is expected to increase gradually due to many BF/BOF investment projects. Therefore, iron ore/coking coal are expected to become important raw materials for the region. Scrap imports have also been increasing due to several mini-mill projects. The region's total steelmaking capacity is expected to increase to 58.8 million tpy by 2017.

Table 1. Change in steelmaking capacity (million tonnes)

	2013 (A)	2017 (B)	Changes	
			(B-A)	(B/A %)
European Union	233.6	231.6	-2.0	-0.9
Other Europe	58.7	64.4	5.8	9.8
CIS	145.9	152.9	7.0	4.8
NAFTA	158.0	163.5	5.5	3.5
Latin America	70.0	77.4	7.4	10.6
Africa	33.2	40.2	7.0	20.9
Middle East	46.2	69.5	23.3	50.5
Asia	1409.2	1552.2	143.0	10.1
Oceania	9.1	9.1	0.0	0.0
Total	2163.9	2360.9	197.0	9.1

Note: Some projects listed in the Annex tables have been announced, but are not likely to come on stream. In calculating future capacity, only those projects likely to come on stream have been taken into account.

Source: OECD Secretariat.

Box 1. Asia will continue to lead the capacity expansion in terms of the BF/BOF process

Since the start of the 21st century, Asia has experienced a steel mill construction boom, supported by investments in many large-sized blast furnaces (with inner volumes of more than 2000 m³). The figure below maps blast furnaces with inner volumes greater than 2000 m³ in Asia compared to the rest of the world. As a consequence, Asian pig iron production expanded rapidly over the decade, rising from 361.3 mmt in 2003 to 900.2 mmt in 2013 and accounting for 77.0% of global pig iron production in 2013. Compared with other regions, Asian integrated mills are typically more modern and have a larger capacity. The region is expected to continue to lead the capacity expansion in the integrated steelmaking route, not least since the figure below indicates a trend towards ever-larger plants in Asia, but not in ROW.

Source: OECD calculations based on data from World Steel Dynamics, China Iron and Steel Association, the Japan Iron and Steel Federation and Korea Iron and Steel Association.

PP ON STEEL EXCESS CAPACITY & INVESTMENT

4.2. Regional steel investments in more detail

4.2.1. Other Europe

The EAF route is common in Turkey and the country has one of the highest shares of EAF output in the world. However, the BF/BOF route has gained some importance in recent years.⁵ Platts (2014b) recently reported that the Turkish government plans to reduce the domestic industry's dependency on scrap by providing more incentives for domestic iron ore and ferro-alloy production. This could encourage a change in the structure of steel production in favour of BOF based integrated mills. The Turkish industry aims to reach 85 mmt of steelmaking capacity and 70 mmt of steel production by 2023 (ISPAT, 2013). Major projects taking place in Turkey include:

- *Kardemir* (one of Turkey's three integrated steelmakers) has begun to fire up its new blast furnace No. 5 with an inner volume of 1 280 m³ at its Karabuk works in the northern part of the country. As a result, and also due to converter upgrades, its crude steel capacity is expected to increase to 3.4 million tpy. *Habas* has just entered the flat product market in Turkey with a new hot strip mill (2.5 million tpy of capacity) and is now building an electric steelmaking complex with a capacity of 3 million tpy.

4.2.2. The Commonwealth of Independent States (CIS)

In the CIS region, numerous mini-mill projects have been planned, reflecting good prospects for the construction sector at least before the recent political unrest. However, the BF/BOF route is likely to remain the main process in the region.⁶ Between 2003 and 2013, the share of crude steel production via the EAF route has risen from 13.5% to 24.4%, according to World Steel Association data. The growth in EAFs (notably in Russia) should have a significant impact on scrap demand. Scrap demand may surpass domestic collection due to new EAFs, though some integrated producers — equipped with both BOFs and EAFs — have an option to increase the use of pig iron in their EAFs in order to reduce their dependence on scrap (Platts, 2012). Some important developments include the following:

Russian electric arc furnace steelmaking is expanding and the government expects the share of EAF production to reach 39% by 2020 (Platts, 2014c).⁷ Between 2013 and 2014, some long product mini-mills were commissioned to meet steel demand from the growing construction sector in the country. *Abinsk Electrometallurgical Plant* and *NLMK Kaluga* commissioned their new EAF melting shops, both with a capacity greater than 1 million tpy. Furthermore, *Severstal* aimed to begin commercial-scale production at its 1 million tpy mini-mill in Balakovo (in central Russia's Saratov region) by the end of the second quarter of 2014.

4.2.3. North American Free Trade Agreement (NAFTA)

In NAFTA, some steelmakers are exploring opportunities for building DRI-based plants. Several DRI plant projects have been announced in recent years to take advantage of shale gas developments. DRI provides opportunities for mini-mill steelmakers to minimize the impact of typically more volatile steel scrap markets (AMM, 2013). Growing DRI production is also likely to affect demand for substitute materials such as pig iron and scrap. EAF's share of steel production in the NAFTA region is expected to rise due to both DRI and scrap-based EAF projects. The upstream (crude) projects that are underway in the region include:

- Some DRI technology suppliers forecast DRI capacity in the United States could reach 10 million tpy by 2020 (Platts, 2014d and 2014e). On 24 December 2013, *Nucor* commissioned its first DRI facility with a capacity of 2 million tpy in Louisiana. Moreover, the European

integrated steelmaker *Voestalpine* is investing USD 740 million to build a 2 million tpy DRI plant in Texas. Also, *Big River Steel* broke ground on its USD 1.3 billion EAF-based steel mill in Osceola, Arkansas on 24 September 2014.

- In Mexico, some mini-mill projects are underway to meet growing demand from the construction sector. For example, *Talleres y Aceros (Tyasa)* has been testing its new EAF with a capacity of 1.2 million tpy in Orizaba. In addition to this, *Altos Hornos de México (Ahmsa)*'s 1.5 million tpy EAF, (part of its USD 1.5 billion *Fenix* program) is expected to be commissioned in 2014. *Gerdau Corsa*'s new EAF plant is expected to come on stream in 2015.

4.2.4. Latin America

In Latin America, many greenfield slab-for-export projects have been announced by major mining groups. However, some projects have been postponed due to reasons such as the global economic slowdown, weak markets and logistical problems. Most of the capacity expansion projects in Latin America will occur in Brazil, where some new slab projects are currently in progress. Some projects in the region are starting in the long products segment to meet demand for construction steel. Major projects occurring in Brazil are provided below.

- Future slab maker *Companhia Siderúrgica do Pecém (CSP)* is a joint venture between Brazilian mining group *Vale* (50%) and Korean steel producers *Dongkuk Steel* (30%) and *POSCO* (20%). The project is expected to begin producing 3 million tpy of slabs in December 2015. *CSP*'s first export shipment is scheduled for March 2016 through the Port of Pecém, in north-eastern Ceará State. Apart from this project, another two slab projects — *Acos Laminados do Para plant (ALPA)* and *Companhia Siderurgica Ubu (CSU)* — have been planned in the country.⁸

4.2.5. Africa

Currently, Africa is aiming to lower its dependence on imports through various upstream projects. Although Egypt and South Africa have played a key role in supplying steel products in Africa, the region still has a low self-sufficiency rate. To increase its self-sufficiency and press forward with industrialisation, many upstream projects (mainly DRI based mini-mill plants) have been planned. These projects are concentrated in North Africa and have the objective of supplying steel for housing and infrastructure projects. The DRI-EAF route has been the preferred steelmaking technology in the region due to its lower capital expenditure requirements and because the region has a shortage of steel scrap.⁹ Projects taking place in some of the major producing countries in Africa include:

- Many DRI-EAF projects are underway in Egypt. However, the country is experiencing a shortage in natural gas allocation, which has delayed the launch of a number of steelworks.¹⁰ *Ezz Steel*, the largest steel producer in Egypt and North Africa, is expected to commission its 1.8 million tpy DRI plant and a 850 000 tpy EAF by end-2014. Moreover, *Beshay Steel*, the second largest steelmaker in Egypt, is building a 1.76 million tpy DRI and 1.3 million tpy EAF. *Egyptian Steel* is building an EAF-based steelworks in Beni Suef and Sokhna that will each have a capacity of 850 000 tpy of square billet.
- Algeria is one of the fastest steel-consuming markets in Africa due to government plans to build infrastructure facilities (OECD, 2014). With domestic steelmakers not producing enough to meet growing demand for steel, the government announced in mid-2011 that it would invest considerable amounts over five years to boost domestic steel production (Oxford Business Group, 2012). Most of the capacity additions will be implemented by state-owned companies. For example, the governments of Qatar and Algeria have decided to enter into a joint venture, the

PP ON STEEL EXCESS CAPACITY & INVESTMENT

Algerian Qatari Solb Company. Moreover, state-owned *Sider* and *ArcelorMittal* aim to boost capacity at their Annaba plant.

- In South Africa, *ArcelorMittal South Africa* is a major producer, accounting for more than 70% of the country's steel production (Kumba Iron Ore, 2011). However, large scale steel plant projects have been announced in the country recently. China's state-owned *Hebei Iron & Steel (Hegang)* announced plans to build a 5 million tpy greenfield steelworks to be supplied by output from its iron ore mine in the country.¹¹ On 10 September 2014, *Hegang* signed a memorandum of understanding with *China-Africa Development Fund* and the South African government's *Industrial Development Corp.* for developing *Hegang's* steelworks project in South Africa. This steel plant will be China's largest steel mill outside the Chinese mainland (WSJ, 2014).

4.2.6. Middle East

With oil-exporting countries within the Gulf Cooperation Council aiming to diversify their economies (IMF, 2014), steel demand from downstream industries is expected to expand in the region. Many projects have been announced recently in the Middle East, often with the objective to reduce import dependency.¹² However, these developments have led to concerns that the industry's expansion might lead to over-supply issues in the region, particularly in the square billet market (Metal Expert, 2014a). Steelmaking is predominantly EAF-based, and the preferred feedstock is DRI, owing to plentiful (and thus relatively low priced) natural gas availability in the region.¹³ DRI is generally expected to remain a major feedstock in EAF steelmaking, and the EAF process, in turn, is expected to continue to play a dominant role in steelmaking route in the region. Major projects taking place in the Middle East include:

Iran aims to expand its steelmaking capacity to 55 million tpy by 2025 (Reuters, 2014). Most new plants will be based on the DRI-EAF route. The country has significant resources of iron ore deposits and low-cost natural gas, and these factors are affecting the choice of raw materials used to produce steel in Iran. Although eight new steelworks have been under construction by state-owned *IMIDRO* since 2006, and numerous projects have been announced, a number of projects were put on hold because of financing constraints caused by economic sanctions.¹⁴ Currently, *Middle East Mines Industries Development Holding Company (MIDHCO)* is involved in three greenfield projects in the country: *Butia Steel Company (BISCO)*, *Sirjan Iranian Steel Company (SISCO)* and *Zarand Iron & Steel Company (ZISCO)*.

In Oman, growing steel demand (driven by construction activity) is encouraging domestic producers to increase their capacities and is attracting new investors to the steel industry. Scrap consumption is expected to grow due to capacity expansion projects, while some companies plan to install DRI modules because domestic scrap collectors may not be able to supply enough material for several years (Metal Expert, 2014b). An example of capacity expansion projects can be found in *Jindal Shadeed Iron and Steel's* project, which involves a 2 million tpy EAF steelmaking complex, including a DRI module. *Sun Metals* and *Moon Iron & Steel (MISCO)* also plan to install EAF facilities.

Saudi Arabia is currently experiencing fast-growing demand for electricity driven by population growth and industrial development (NOREF, 2013). Although a shortage in natural gas allocation and electricity generation capacity has delayed the launch of a number of steelworks in the country, many EAF projects are currently underway to balance billet imports.¹⁵ For example, *Saudi Iron & Steel Company*, the largest integrated steelmaker in the Middle East, started trial runs at its sixth electric arc furnace of 1 million tpy in February 2014. Also, *Arkan Steel* and *Al Atoun Steel* are building EAF-based plants.

4.2.7. China

Currently, the Chinese government is making efforts to restructure the steel industry, increase its efficiency and remove some excess capacity (EY, 2014). In October 2013, China's State Council released

a Guideline (the Guideline to Resolve Serious Overcapacity), targeting the closure of 80 million tpy of steel capacity by the end of 2017 (OECD, 2014), in addition to addressing overcapacity problems in the cement, aluminium, plate glass and shipbuilding industries. Targets of the plan include reasonable capacity utilisation, improved industrial concentration and structure, higher development quality, efficient environmental protection, a normal level of profit margin and asset-liability ratio, and a long-term effective mechanism in self-regulating capacity.

The Guideline to Resolve Serious Overcapacity includes supply-side management measures, notably the prohibition of new steel projects, the removal of existing illegal capacity, the enhancement of the entry threshold, and phasing out the backward capacity by raising prices of power and water. Financial support could be provided if difficulties linked to capacity shutdowns and unemployment arise. In addition, broad demand side measures as well as systematic management measures will also be used to address overcapacity. On the demand side, efforts will involve the construction sector's use of steel and improving the standards of steel. Systematic management includes encouraging mergers and acquisitions of enterprises to increase industrial concentration and reduce over-competition, among other efforts.

Since July 2014, China's Ministry of Industry and Information Technology (MIIT) has revealed lists of steelmakers that should remove obsolete capacities.¹⁶ Also, provincial governments were requested to submit, by 30 June 2015, their targets for dismantling outdated and excess capacities in 2015 and during the 13th five-year (2016-2020) economic development plan (MIIT, 2014).¹⁷

Some important coastal steelworks have been put into operation over the last few years in China: *Anshan Iron & Steel* commissioned its 6.5 million tpy Bayuquan works in Liaoning Province in 2008, while *Shougang Jingtang United Iron & Steel* completed its 9.7 million tpy works in Hebei Province in 2010. Many projects have been announced in resource-rich inland regions. For example, Xinjiang's rich raw material resources have attracted many steelmakers to invest in new capacities in the region.¹⁸ Although the BOF production process will remain the dominant production process in China in the years to come, the EAF share may increase gradually along with increasing availability of domestic scrap, but the process is likely to take some time (Japan Metal Bulletin, 2014).¹⁹ Despite a slowdown in China's capacity growth rate compared to previous years, large steelworks that focus on the production of flat products are being built in the country, namely:

Baosteel could commission the first of two 5 050 m³ blast furnaces at its Zhanjiang steelworks (Guangdong Province) by the end of September in 2015. The entire steelworks is expected to be commissioned by June 2016.²⁰ On 26 September 2014, *Wuhan Iron & Steel Group* set up the *Fangchenggang Steel Company Limited* that would be responsible for the operations management of its steel project in Guangxi Province. The new integrated steelworks is designed to be able to produce 9.2 million tpy of crude steel with two 5 200 m³ blast furnaces. *Shandong Iron and Steel Group* plans to launch its 8.5 million tpy Rizhao steelworks in Shandong Province by the end of 2016, with two 5 100 m³ blast furnaces.

- Other important projects are either underway or being planned. In China's Inner Mongolia, *Baotou Iron & Steel* plans to build two 4 000 m³ blast furnaces at a new integrated flat steel works, which will have a crude steel capacity of 5 million tpy. Also, on 4 July 2014, a memorandum of understanding for a total investment of USD 3.3 billion was officially signed between *Chongqing Iron & Steel (Chonggang)* and *POSCO*. The two companies will cooperate to construct a plant using *POSCO*'s FINEX technology.

PP ON STEEL EXCESS CAPACITY & INVESTMENT

4.2.8. India

Based on forecasts for steel consumption, India's authorities expect that steelmaking capacity may have to increase to 300 million tpy by 2025-26 in order to meet future demand (Government of India, Ministry of Steel, 2013). In order to reach that level of capacity, the industry may need to invest around 12 trillion rupees, according to some news sources, with investment being concentrated in the mineral-rich states of Odisha and Jharkhand (Platts, 2014i). New investment projects that are iron ore/coking coal intensive should have significant impacts on the balance between BOF and EAF production in the future. Despite the declining trend over the last 10 years, BOF's share in Indian production is expected to grow significantly as many BF/BOF projects have been announced or are currently being built in the country.²¹ Many important BF/BOF projects are taking place in India, amongst which:

- Some upstream projects are underway by state-owned companies that have already launched their strategic plans.²² *National Mineral Development Corp (NMDC)* has delayed commissioning of its 3 million tpy integrated steel plant with a 4 506 m³ blast furnace, currently under construction at Nagarnar in the eastern state of Chhattisgarh. *Steel Authority of India Ltd. (SAIL)* is also building two blast furnaces with inner volumes of 4 060 m³ at IISCO Burnpur works and Bhilai works. Also, India's leading private company, *Tata Steel*, expects to commission the first phase of its 3 million tpy integrated mill by March 2015, including a 4 300 m³ blast furnace.

4.2.9. Association of Southeast Asian Nations (ASEAN)

Although the Association of Southeast Asian Nations (ASEAN) has traditionally been a large net importer of steel, a steel mill construction boom has been taking place in the region, as well as in other East Asian economies that export to ASEAN.²³ Many steel projects should support the increase in ASEAN's self-sufficiency rate. However, these developments have led to concerns that the industry's expansion might lead to over-supply problems (OECD, 2013a). DRI and scrap have been the major feedstock for steel production in the region because production takes place primarily in EAF-based facilities. However, BOF's share in the region's production is expected to increase gradually, thus affecting the balance of steelmaking technologies and, ultimately, raw material demand. Below is a brief summary of the major projects taking place in ASEAN.

- In Indonesia, investment in new steelmaking capacity is taking place in view of relatively favourable demand prospects. Examples of investment projects include *PT Krakatau POSCO*, which formally began operating its first blast furnace (the size of which is 3 950 m³) on 23 December 2013 in Cilegon. The plant has a capacity of 3 million tpy. This project is part of Indonesia's Master Plan to accelerate economic development (OECD, 2013b). *PT Krakatau POSCO* will make a decision on whether to proceed with the second stage expansion in 2015. Moreover, *PT Gunung Raja Paksi* is building a 2 500 m³ blast furnace with a capacity of 1.5 million tpy in West Java, along with a sinter plant and a coke battery.
- In Viet Nam, strong steel demand growth has attracted many foreign investors and numerous projects have been planned. According to the government of Viet Nam, capacity is targeted to reach 40 million tpy of steel billets by 2025 (Ministry of Industry and Trade of Vietnam, 2013). Currently, some BF-BOF projects are underway in the country. For example, *Formosa Ha Tinh Steel Corp* has already started construction, with the first phase of a 10.5 million tpy plant to be fully commissioned by end-May 2017.²⁴ In addition, state-owned *Vietnam Steel Corporation (VSC)* has commissioned its new steel plant. Also, *POSCO Specialty Steel* aims to officially inaugurate its 1 million tpy EAF in Ba Ria-Vung Tau province either in December 2014 or slightly thereafter.²⁵

5. Concluding remarks

Excessive levels of steelmaking capacity have important implications for the steel industry, often associated with over-supply, low prices, weak profitability, bankruptcies and localised job losses. Recent work conducted by the OECD has examined the financial health of the steel industry and established a link between excess capacity and profitability. It has shown that the financial performance of the industry is perhaps worse now than it was during the global steel crisis of the late 1990s, in large part due to the significant excess capacity that exists today.

Given the global nature of the industry, excess capacity in one region can displace production in other regions, thus harming producers in those markets and creating risks for trade actions and government interventions to protect domestic industries. It can also lead to wasteful energy use and thus have negative environmental impacts.

Increased trade frictions are already visible amongst trading partners today. Subsidies and government support measures that promote investment in steelmaking facilities or sustain companies in distress that would otherwise shut down are a major source of this trade friction. Subsidies that encourage steelmakers to keep production running at high levels, even under weak market conditions, have had significant effects on trade, with unfair trade practices such as dumping having resulted in injury to the industries of other economies.

In competitive economies, it is the responsibility of the steel companies themselves to identify ways to adapt to changing market conditions. That is, businesses are best placed to decide on when to invest in new capacity or when to scale it back when market conditions change. The role of governments should be to allow market mechanisms to work properly and avoid measures that artificially support steelmaking capacity.

A key priority, therefore, is to identify appropriate policy approaches to address excess capacity. In this context, of particular importance for governments will be to work towards removing market distorting policies such as subsidies that promote the emergence of new capacity or delay the closure of failing companies, eliminating trade and investment barriers that slow the restructuring that is needed for the industry, allowing market-based investment decisions in the steel sector, and ensuring that new plants are subject to standards that protect the environment and uphold worker safety.

The OECD Steel Committee has continued to deepen its discussions on capacity, and plans to take this work further in its programme of work and budget for 2015-2016. For example, the Committee's programme of work calls for analyses of government policies and their implications for global excess capacity developments, as well as maintaining a database of ongoing investment projects, including the sources of finance for steel projects and any government support measures provided. At a later stage, the Committee may consider organising a high-level meeting to facilitate discussion on excess capacity issues at a higher political level. A key aim of this work will be to establish common perspectives on ways to avoid practices that create harmful trade and competitive distortions, and which can lead to a long-lasting positive impact on the effective functioning of the global steel market.

NOTES

1. An important item discussed at the OECD Ministerial Council Meeting (MCM), which was held in May 2014 and chaired by Japan, was about resilient economies and societies. The MCM Chair's Summary made specific reference to steel: "Ministers also discussed positive shifts in employment and production patterns, the future of manufacturing as well as entrepreneurship, including the role of young firms and SMEs, and stressed the need to address the issue of excess capacity in some global industries, such as steel, in relation to supporting measures."
2. Readers who identify changes in project characteristics are encouraged to contact the Secretariat.
3. This comprises Albania, Bosnia-Herzegovina, Croatia, Macedonia, Montenegro, Norway, Serbia, Switzerland, and Turkey.
4. Recent reports suggest that China's actual crude steelmaking capacity could be higher than estimated. A Platts (2014a) report notes that Chinese capacity reached 1.11 billion tpy in 2013 and will increase to 1.14 billion tpy in 2014, according to China Iron and Steel Association.
5. For example, Isdemir blew-in its No. 4 blast furnace with an inner volume of 2 500 m³ in 2011. In 2013, scrap imports decreased by 12.0% to 19.7 mmt compared with 2012, while iron ore imports were up by 3.5% to 8.1 mmt, according to data from the World Steel Association.
6. According to the World Steel Association data, the share of BOF in the CIS region has grown to 67.7% in 2013, i.e. by 10 percentage points from its level 10 years earlier.
7. The Russian steel industry is aiming to replace all of its OHF facilities by 2015 (Russian Steel Consortium, 2013). Ukraine expects to complete the replacement of its OHF technology by 2018 (SE UEX, 2014).
8. These projects do not seem however to be progressing as expected.
9. The BOF to EAF ratio in South Africa is high (59:41), according to the World Steel Association data. This reflects the important role of iron ore and coking coal in the country.
10. Egypt has decided to remove natural gas subsidies, and some observers expect the price of gas used by cement, iron and durable good factories to increase by 30-75% (Al-Monitor, 2014). This measure will affect those steelmakers operating DRI modules that use natural gas. Observers have noted that scrap imports could increase due to natural gas shortage (Platts, 2013a).
11. *Hegang* already owns iron-ore mining assets in South Africa, having participated in a consortium established to buy *Rio Tinto's* 57.7% interest in *Palabora Mining Company* (Creamer Media, 2014).
12. Observers have noted, however, that the fast growth in power consumption may curb future capacity growth (Markaz, 2013).
13. According to data from the World Steel Association, the region's share of crude steel production via the EAF route has risen significantly to 92.4% in 2013 (9.3 percentage points higher than 10 years earlier).

PP ON STEEL EXCESS CAPACITY & INVESTMENT

14. Although the Iranian government is making efforts to attract private investors. See Platts (2014f) for more on this.
15. Saudi Arabia's government aims to boost power-generation capacity by more than 50% from less than 60 gigawatts (GW) to approximately 91 GW by 2020 (ABB, 2014).
16. In July 2014, MIIT announced the first list of steelmakers that should remove obsolete capacities in 2014, including iron and steel and a total of 25.45 million tpy of ironmaking capacities and 22.60 million tpy of steelmaking capacities should be removed by end-2014. Furthermore, MIIT released the second list on 18 August 2014 and the third list on 25 August 2014.
17. This information is available at: <http://cys.miit.gov.cn/n11293472/n11295023/n11297848/16159494.html>
18. Observers have noted that the central government's keenness to develop western China's economy caused a rush of new steel projects in Xinjiang, which may lead to oversupply (Platts, 2013b).
19. China Iron and Steel Association (CISA) expects EAF output will be 25-30% of the total crude steel production by 2025 (Platts, 2014g).
20. The Guangdong Provincial Development & Reform Commission decided to remove 4.5 million tpy of crude steel capacity in the province by 2017, in order to make room for the Zhanjiang steelworks (Platts, 2014h).
21. India has faced several barriers to capacity expansions. For example, the acquisition of land, the granting of environmental and forest clearances, the availability of raw materials and the lack of infrastructure are major challenges (OECD, 2014).
22. SAIL aims to increase its steelmaking capacity to 50 million tpy by 2025. On the other hand, RINL plans to expand capacity of its Visakhapatnam steelworks to 12 million tpy by 2020.
23. For example, in East Asian economies, operations at large-scale blast furnaces were started in both Korea and Chinese Taipei in 2013.
24. The commissioning of the No. 1 blast furnace with an inner volume of 4 350 m³ is expected to be delayed until November 2015 due to the protests which occurred in May 2014. When fully implemented by 2020, this steelworks will be the largest integrated steel plant in the ASEAN region (OECD, 2013a).
25. Ferrous scrap imports have been increasing, notably in Viet Nam, while Australia has become a major scrap exporter to ASEAN.

ANNEX: FUTURE CAPITAL INVESTMENT PROJECTS**Abbreviations used for equipment**

DR	Direct reduction unit
BF	Blast furnace
BOF	Basic oxygen furnace
EAF	Electric-arc furnace
EOF	Energy optimising furnace
IF	Induction furnace
Steelmkg	Unspecific steelmaking unit

In the tables below the “Ownership” column shows a distinction between state-owned plants or projects (S) and those which are privately owned (P). The status of a company’s ownership was taken from the information sources used to update these tables and does not necessarily correspond to definitions of state ownership used within the OECD. Investment costs given in this list show are the total investment for each project. The volume of blast furnaces refers to the inner volume. The information on individual investment projects presented in this Annex is also provided via an online database available to the public at www.oecd.org/sti/steel.

NOTE CONCERNING THE DATA

While this document has been declassified by the OECD Steel Committee, some of the data in the following tables may have become outdated during the course of data collection and may not accurately reflect actual investment developments in the global steel sector. In addition, some current and future investment projects that are taking place may have been overlooked and thus may not appear in the tables. Readers who identify changes in the characteristics of the projects listed are encouraged to contact the Secretariat with relevant information and documentation.
